Triploids do NOT produce sufficient pollen for normal pollination, a normal seeded variety must be planted to supply the necessary pollen. They also require HIGHER soil temps and OPTIMUM moisture.

The kinds marked with asterisks are usually indoors in early spring and the seeding rate in Columns 1 and 2 is for that method.

\* Transplanted.

\*\*Seeding rates and spacings recommended above are, for the most part, figured on the basis of harvest by hand. High density planting rates and precision seed placement becomes necessary on most mechanically harvested vegetable crops. The effect of arrangement and plant density in relation to fruit size, quality and total yield will vary depending on local environmental conditions during the planting, growing and harvest seasons. Plant density must depend greatly on available planting and harvesting equipment. Seeding rates should depend in part on the total seed count (per oz. or lb.) of the seed lot being used.
